I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

DETAILED ACTION

1. This office action is in response to applicant's response filed on 06/26/2009.
2. Claims 1-6, 8-10, 12-14, and 16-21 are pending.
3. Claims 7, 11, and 15 are cancelled.
4. Applicant's arguments are persuasive in the light of Applicant Remarks filed on 06/26/2009. Therefore the rejections of the claims have been withdrawn.

Allowable Subject Matter

1. Claims 1-6, 8-10, 12-14, and 16-21 are allowed.
2. Independent claims 1, 19, and 20-21 are the inclusion of the following limitations that are not found in the prior art and they are uniquely distinct features. The closest prior arts are Ostrovsky et al., Patent No. US 5,123,045 and Fielding et al., Pub. No. US 2004/0172551.

Ostrovsky discloses an efficient software protection scheme is presented in which a data processing system provides comprehensive software protection using hardware and software measures. Specifically, it provides protection of the pattern of access to memory during execution of a program and also provides protection of the data stored in memory. The protection scheme is secure in the sense that it behaves like a black box which reveals no information other than the I/O behavior and running time. Thus, not only the values stored in the general purpose memory are hidden, but

Art Unit: 2434

also the sequence in which memory location are accessed during execution is hidden.

This comprehensive scope of protection is achieved by an extremely efficient scheme.

In particular, if the running time of the original program is T , the running time of the

protected program is only slower by some factor of $(\log T)^{\sup C}$ where C is a small

constant. And Fielding discloses a process of screening one or more software files to

determine any that are recognized to have a matching hash signature with a file

contained in a database of files known to be Virus, Trojan, Worm, or otherwise

potentially malicious or suspicious which then can be safely blocked, quarantined and/or

deleted. This is accomplished through a method and apparatus running on a firewall,

network device, mail server, server, personal computer, PDA, cell phone or wireless

device to compare the hash signature of each incoming software file against a regularly

updated database of known infected file hash signatures. One or more users can be

alerted when an infected file is identified. If quarantined the file is safely stored until

virus software is updated properly with later developed virus definitions file(s), which are

then used to eradicate or clean the infected file(s) or computer systems.

However, these arts individually or in combination, fail to anticipate or render the following limitations: "A method for detecting hostile software in a computer system comprising:

storing a representation of configuration data associated with an operating system for the computer system obtained at a first time, wherein the stored representation of configuration data is encrypted prior to being stored;

comparing the stored representation of the configuration data obtained at the first time with a representation of the configuration data associated with the operating system for the computer system obtained at a second time, wherein the operating system is actively operating at the second time; and

if deviation is detected between the stored representation of the configuration data obtained at the first time and the representation of the configuration data obtained at the second time, automatically performing at least one remedial measure in response to the deviation detected, wherein the operating system continues to operate after the at least one remedial measure is performed, wherein the at least one remedial measure comprises determining a storage location associated with suspected executable code in the computer system and moving suspected executable code to a specified storage location for later evaluation, and wherein the at least one remedial measure further comprises determining whether the suspected executable is being executed, and if the suspected executable code is being executed, terminating the execution of the suspected executable code without first providing warning to the suspected executable code prior to terminating the execution to prevent the suspected executable code from performing one or more countermeasures.” as claimed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”
